Authors: Elias Perras, Marius Mellmann

Heat Equation

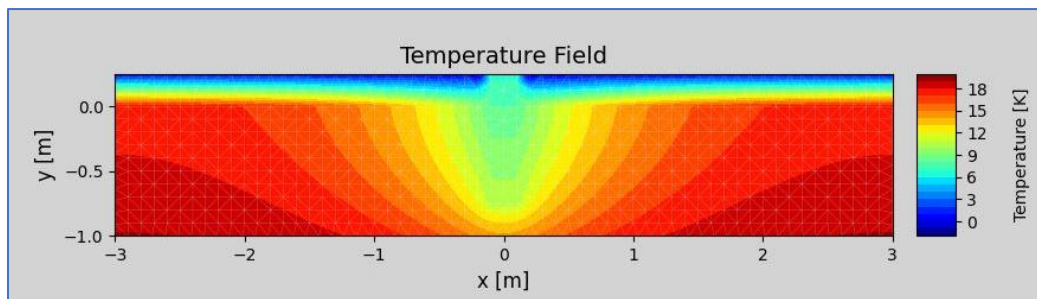

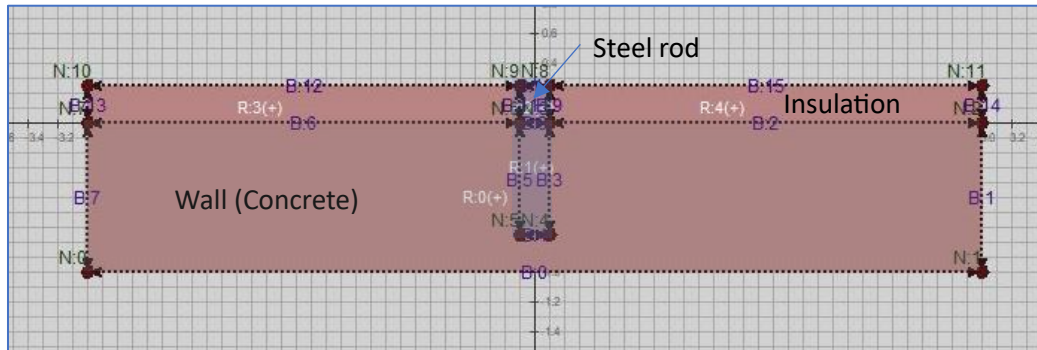

Example 1

- Walls: $k = 1 \text{ W/mK}$
- Round filling: $k = 0.5 \text{ W/mK}$
- Outside: $T = 0^\circ\text{C}$ $h = 25 \text{ W/m}^2\text{K}$
- Inside: $T = 25^\circ\text{C}$ $h = 5 \text{ W/m}^2\text{K}$

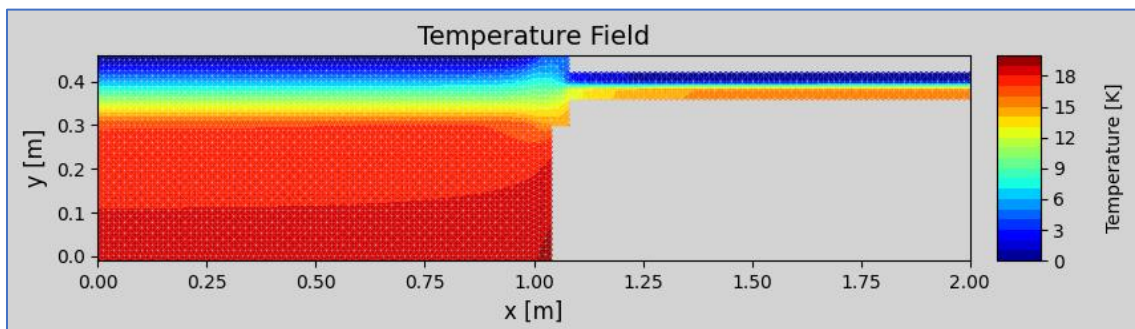

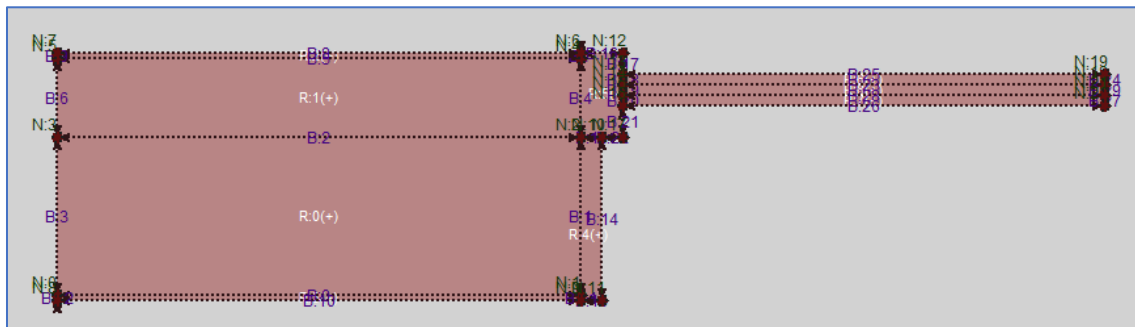

Example 2

- Metal rod through insulation
- Outside: $T = 0^\circ\text{C}$ $h = 25 \text{ W/m}^2\text{K}$
- Inside: $T = 20^\circ\text{C}$ $h = 4 \text{ W/m}^2\text{K}$

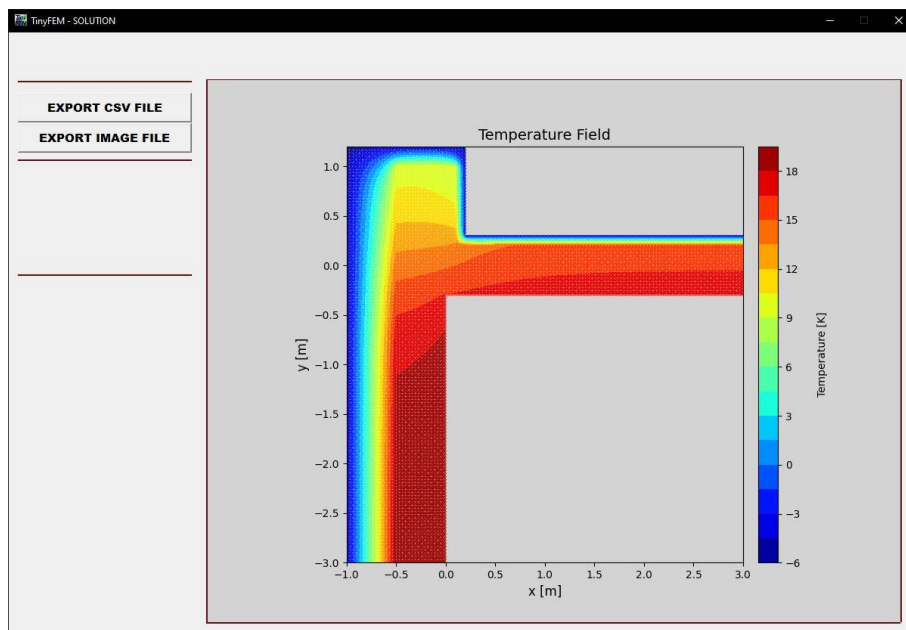

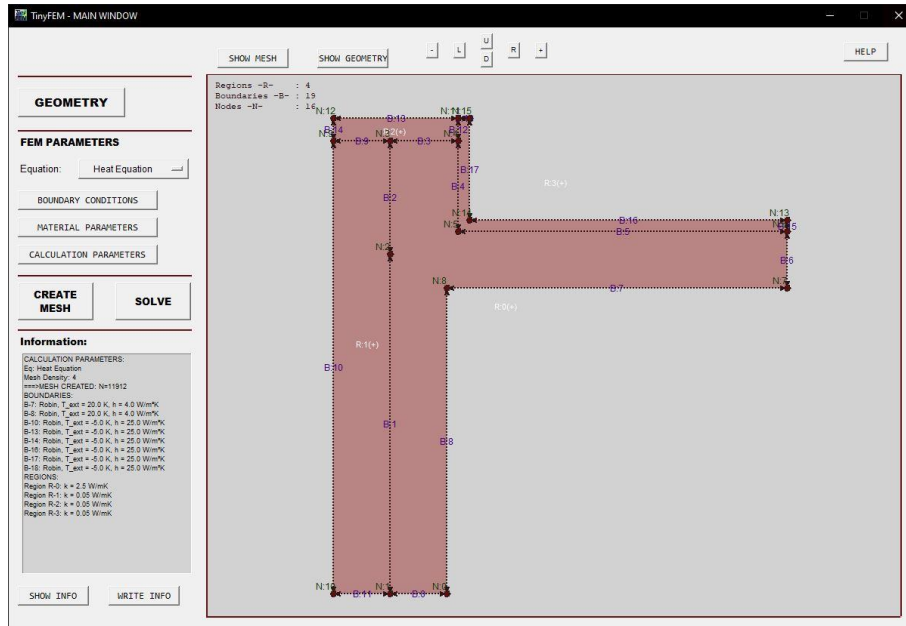

Example 3

- Some wall structure with embedded double pane window and different materials

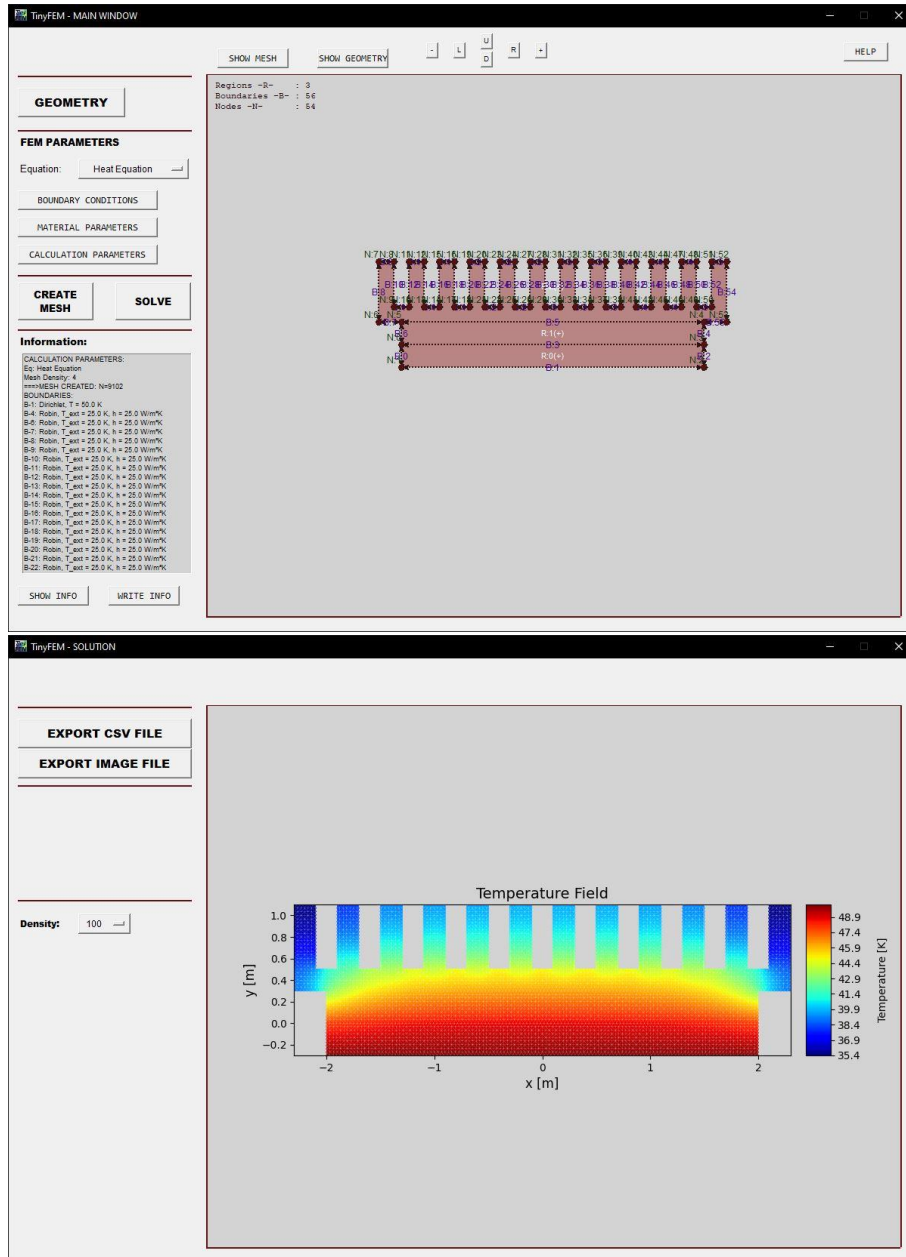

Example 4

- Insulated outer wall

Example 5

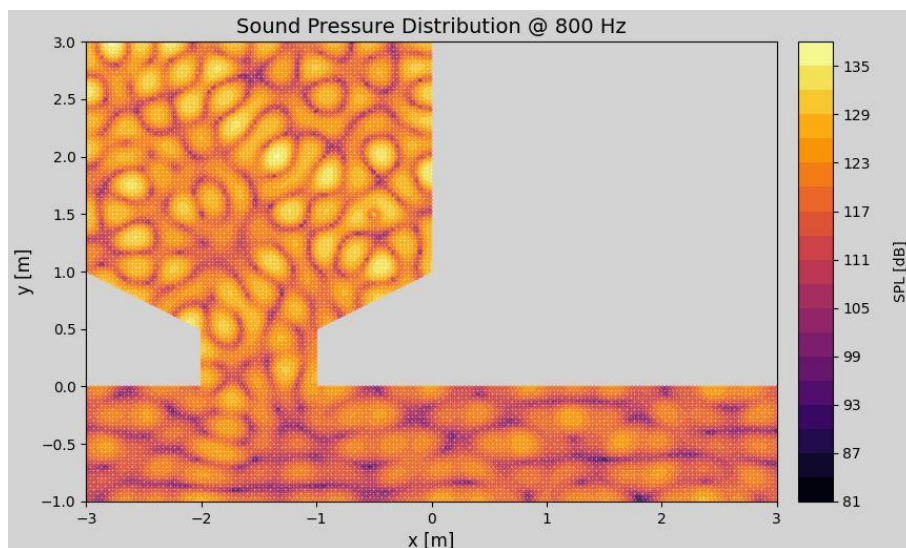

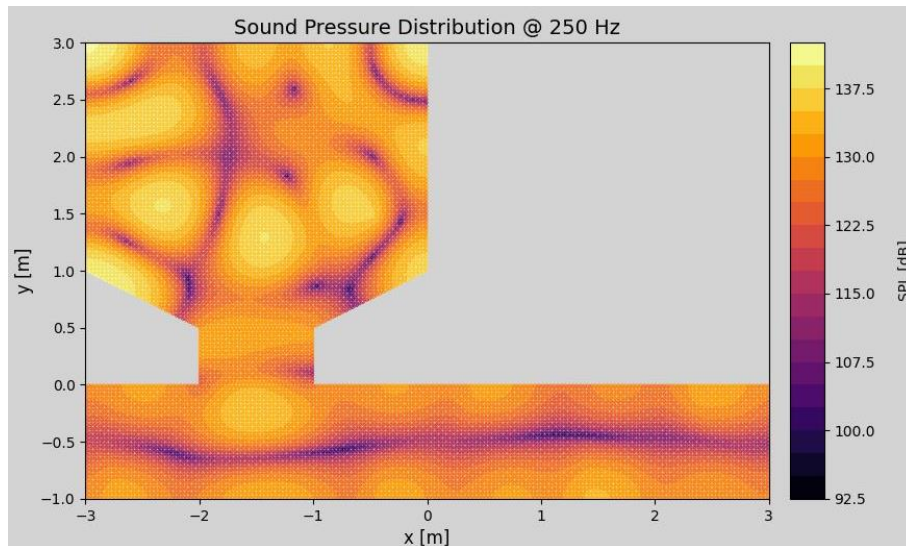

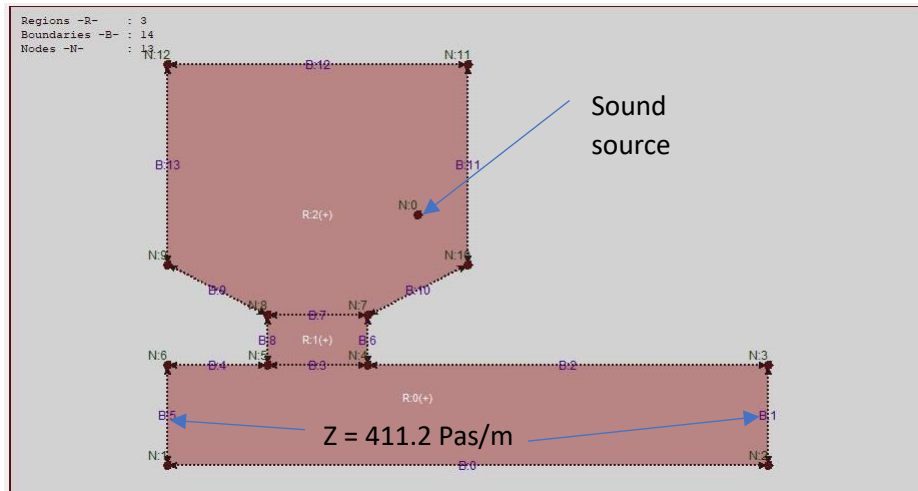

- Heatsink

Helmholtz Equation

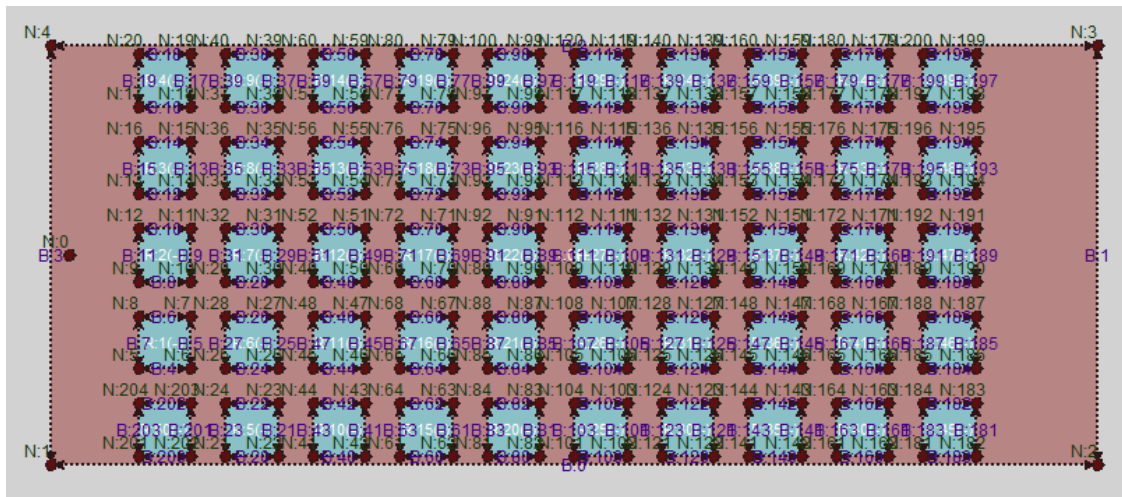

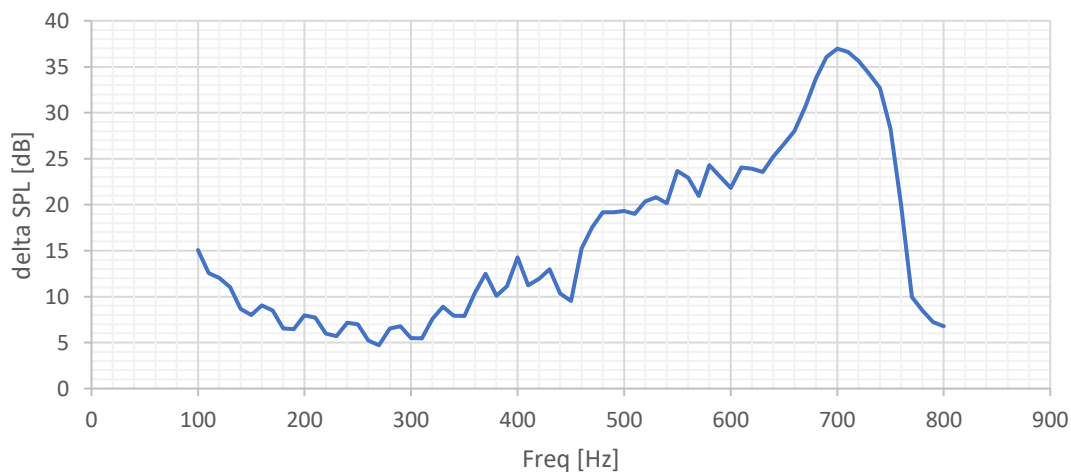

Example 1: Hallway

- Sound propagation in hallway (medium air)

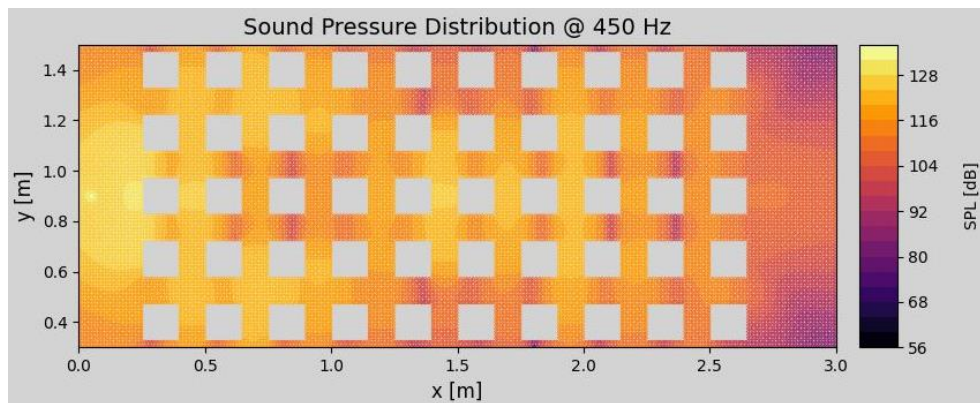

Example 2: Phononic Crystal

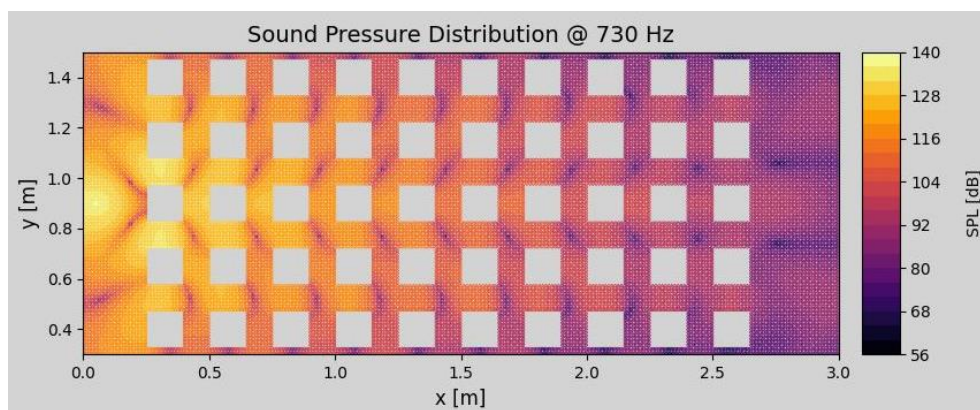

- A phononic crystal is a material or structure designed to control the propagation of sound waves in a way that allows certain frequencies of sound to be blocked or allowed to pass through.

delta SPL $B-1 - B-3$ 

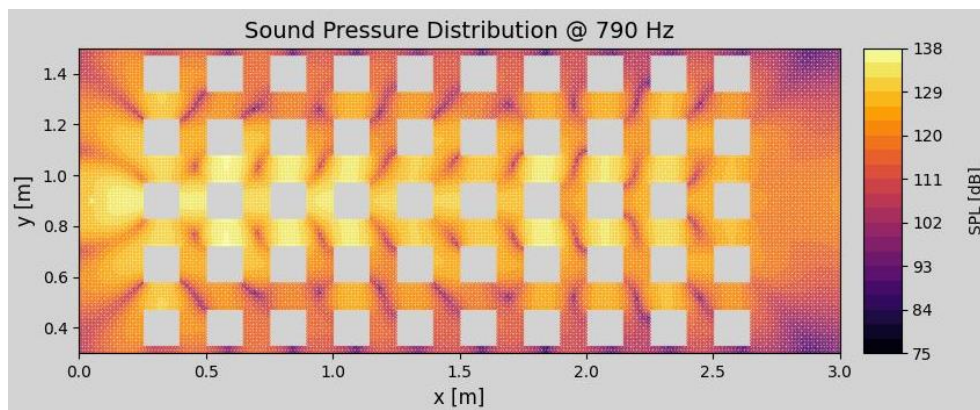

Blocked frequency:

Bandgap frequency:

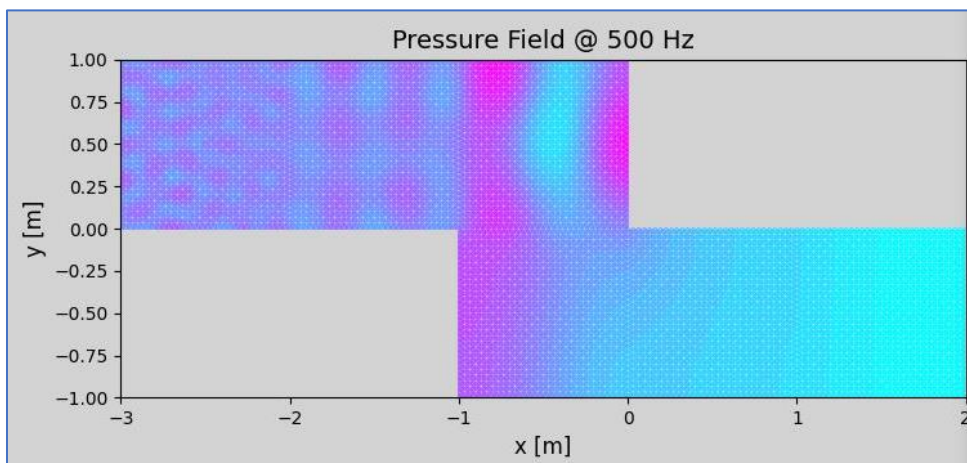

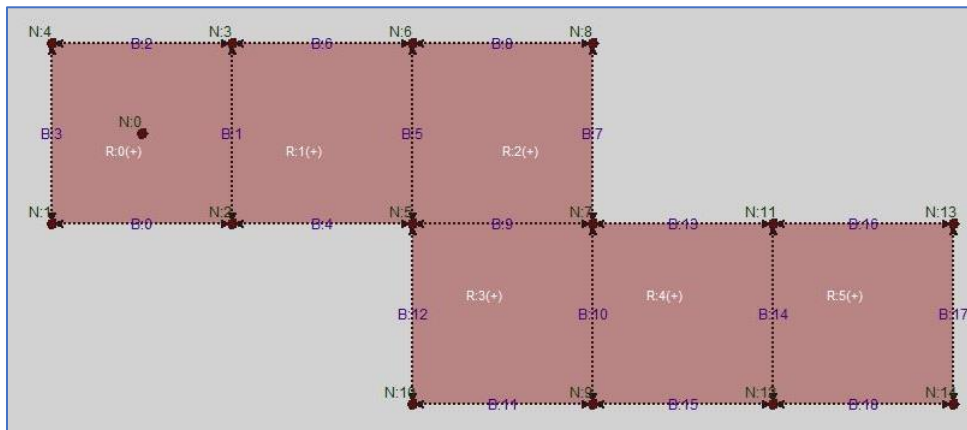

Blocked frequency:

Example 3: Sound propagation through different materials

- Varying values for speed of sound and density for regions

Example 4: Sound barrier
